Free Windows desktop application launched to monitor power cuts

A South African based software development house has launched an energy focused website and a free Windows desktop application that aims to help South Africans stay in control of the current power crisis.

Available as a free download from www.myenergy.co.za will be **MyEnergy Monitor**, a small desktop utility that will allow users to monitor the country's fluctuating power status. It will give the user the ability to monitor selected load shedding schedules by location, for example, at home, at work, clients, suppliers and branches... simultaneously!

MyEnergy Monitor aims to eliminate the confusion surrounding the schedules currently available to the public and present only relevant information in a logical format.

In addition, **MyEnergy Monitor** will perform custom actions upon the detection of a expected power outage. These include a simple desktop notification, automatic computer shutdown and, for system administrators, Windows event logging.

Users can download the MyEnergy Monitor desktop application, free of charge, from www.myenergy.co.za.
